

On-Roof and Aerial Roof Moisture Survey Services

By United Infrared Services

United Infrared Services, the providers of RoofScanIR™ is the largest network of infrared thermographers in the world, with 200 thermographers in the US and over 100 trained and certified to perform roof moisture surveying.

Why perform RoofScanIR™ Infrared Moisture Surveys?

By using infrared thermography, you will know where to find trapped moisture in most roofing systems. RoofScanIR™ thermographers take infrared pictures of these wet areas and/or mark the outlines of the wet areas directly on the roof and on drawings. This lets you know how much insulation needs to be replaced for a re-roof or repair. More good reasons include:

- Consistent quality survey reports from the leader in the infrared thermography business.
- Pre-negotiated low prices from a nationwide company, so someone local works with you.
- A more efficient and effective maintenance program for your clients.
- Aerial infrared surveys are also available for large or inaccessible roofs.
